

Percent Slope Tool

NAME _____

Measure the angle of each line on the tool, and write the angle measure in the parentheses below the percent slope measurement.

- To create your own percent slope tool, cut out the tool, glue it to heavy cardstock, and punch a hole through the circle. Then, tie a weight to the end of a piece of string, put the string through the hole, and tape the unweighted end of the string to the back of the tool.
- To use the tool, hold it as directed, and the weighted string will indicate the percent slope.
